

1) Introducing gem5

gem5 is freely available at: <http://gem5.org/>

the laboratory version uses the ALPHA CPU model previously compiled and placed at:

```
/opt/gem5/
```

the ALPHA compilation chain is available at:

```
/opt/alphaev67-unknown-linux-gnu/bin/
```

- a. Write a hello world C program (hello.c). Then compile the program, using the ALPHA compiler, by running this command:

```
~/my_gem5Dir$ /opt/alphaev67-unknown-linux-gnu/bin/alphaev67-unknown-linux-gcc -static -o hello hello.c
```

- b. Simulate the program

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -c hello
```

In this simulation, gem5 uses *AtomicSimpleCPU* by default.

- c. Check the results

your simulation output should be similar than the one provided in the following:

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -c hello
gem5 Simulator System. http://gem5.org
gem5 is copyrighted software; use the --copyright option for details.

gem5 compiled Sep 20 2017 12:34:54
gem5 started Jan 19 2018 10:57:58
gem5 executing on this_pc, pid 5477
command line: /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -c hello

Global frequency set at 1000000000000 ticks per second
warn: DRAM device capacity (8192 Mbytes) does not match the address range assigned (512 Mbytes)
0: system.remote_gdb.listener: listening for remote gdb #0 on port 7000
warn: ClockedObject: More than one power state change request encountered within the same simulation tick
**** REAL SIMULATION ****
info: Entering event queue @ 0. Starting simulation...
info: Increasing stack size by one page.
hola mundo!
Exiting @ tick 2623000 because target called exit()
```

•Check the output folder

in your working directory, gem5 creates an output folder (m5out), and saves there 3 files: config.ini, config.json, and stats.txt. In the following, some extracts of the produced files are reported.

•Statistics (stats.txt)

```
----- Begin Simulation Statistics -----
sim_seconds      0.000003      # Number of seconds simulated
sim_ticks        2623000      # Number of ticks simulated
final_tick       2623000      # Number of ticks from beginning of simulation
```

```

sim_freq          1000000000000    # Frequency of simulated ticks
host_inst_rate    1128003          # Simulator instruction rate (inst/s)
host_op_rate      1124782          # Simulator op (including micro ops) rate(op/s)
host_tick_rate    564081291        # Simulator tick rate (ticks/s)
host_mem_usage    640392           # Number of bytes of host memory used
host_seconds      0.00             # Real time elapsed on the host
sim_insts         5217             # Number of instructions simulated
sim_ops           5217             # Number of ops (including micro ops) simulated
... ..
system.cpu_clk_domain.clock 500    # Clock period in ticks
... ..

```

•Configuration file (config.ini)

```

... ..
[system.cpu]
type=AtomicSimpleCPU
children=dtb interrupts isa itb tracer workload
branchPred=Null
checker=Null
clk_domain=system.cpu_clk_domain
cpu_id=0
default_p_state=UNDEFINED
do_checkpoint_insts=true
do_quiesce=true
do_statistics_insts=true
dtb=system.cpu.dtb
eventq_index=0
fastmem=false
function_trace=false

```

2) Simulate the same program using different CPU models.

Help command:

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py -h
```

List the CPU available models:

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --list-cpu-types
```

a. *TimingSimpleCPU* simple CPU that includes an initial memory model interaction

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --cpu-type=TimingSimpleCPU -c hello
```

b. *MinorCPU* the CPU is based on an in order pipeline including caches

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --cpu-type=MinorCPU --caches -c hello
```

c. *DerivO3CPU* is a superscalar processor

```
~/my_gem5Dir$ /opt/gem5/build/ALPHA/gem5.opt /opt/gem5/configs/example/se.py --cpu-type=DerivO3CPU --caches -c hello
```

Create a table gathering for every simulated CPU the following information:

- Ticks
- Number of instructions simulated
- Number of CPU Clock Cycles
 - Number of CPU clock cycles = Number of ticks / CPU Clock period in ticks (usually 500)
- Clock Cycles per Instruction (CPI)

- $CPI = \text{CPU Clock Cycles} / \text{instructions simulated}$
- Number of instructions committed
- Host time in seconds
- Number of instructions Fetch Unit has encountered (this should be gathered for the out-of-order processor only).

TABLE1: Hello program behavior on different CPU models

Parameters	AtomicSimpleCPU	TimingSimpleCPU	MinorCPU	DeriveO3CPU
Ticks	2593000	374593000	33361500	18735000
CPU clock domain	500	500	500	500
Clock Cycles	$2593000/500=5186$	$374593000/500=749186$	$33361500/500=66723$	$18735000/500=37470$
Instructions simulated	5157	5157	5169	4957
CPI	$5186/5157=1,0056234245$	$749186/5157=145,2755$	$66723/5169=12,8212$	$37470/4957=7,5590$
Committed instructions	5157	5157	5169	5156
Host seconds	0.02	0.03	0.04	0.06
Instructions encountered by Fetch Unit	/	/	/	10606

Nel file stats.txt il numero dei clock cycles a volte è pari a $\text{Ticks}/(\text{CPU clock domain}) + 1$

In particolare :

- AtomicSimpleCPU – Clock Cycles = 5187
- Timing SimpleCPU – Clock Cycles = 749186
- MinorCPU – Clock Cycles = 66273
- Deriveo3CPU – Clock Cycles = 37471

Download the test programs related to the **automotive** sector available in MiBench: `basicmath`, `bitcount`, `qsort`, and `susan`. These programs are freely available at <https://github.com/embecosm/mibench>

- a) compile the program `basicmath` using the provided *Makefile* using the ALPHA compiler *hint*:

add a variable to the *Makefile* in order to use the ALPHA compiler:

```
CROSS_COMPILE = /opt/alphaev67-unknown-linux-gnu/bin/alphaev67-unknown-linux-gnu
CC=$(CROSS_COMPILE)-gcc
```

and substitute all the `gcc` occurrences with the new variable as follows:

```
gcc → $(CC)
```

then compile:

```
~/my_mybench_dir/automotive/basicmath/ make
```

- b) Simulate the program `basicmath` using the *large* set of inputs (i.e., compile `basicmath_large.c`) and the default processor (*AtomicSimpleCPU*), saving the output results. In the case the simulation time is higher than a couple of minutes (it is host-dependent!), modify the program in order to reduce the simulation time; for example, in the case of `basicmath`, it is necessary to reduce the number of iterations the program executes in order to reduce the computational time.

TODO (in case of long simulation time): To reduce the simulation time of `basicmath_large.c`, modify the number of iterations of the for loops as follows (**RED arrow**):

```
76 /* Now solve some random equations */
77 for(a1=1;a1<10;a1+=2) { // EDITED
78     for(b1=10;b1>0;b1-=1) { // EDITED
79         for(c1=5;c1<15;c1+=1) { // EDITED
80             for(d1=-1;d1>=-5;d1+=.5) { // EDITED
81                 SolveCubic(a1, b1, c1, d1, &solutions, x);
82                 printf("Solutions:");
83                 for(i=0;i<solutions;i++)
84                     printf(" %f",x[i]);
85                 printf("\n");
86             }
87         }
88     }
89 }

90
91 printf("***** INTEGER SQRT ROOTS *****\n");
92 /* perform some integer square roots */
93 for (i = 0; i < 1000; i+=2) // EDITED
94 {
95     usqrt(i, &q);
96     // remainder differs on some machines
97     // printf("sqrt(%3d) = %2d, remainder = %2d\n",
98     printf("sqrt(%3d) = %2d\n",
99         i, q.sqrt);
100 }
101 printf("\n");
102 for (l = 0x3fed0169L; l < 0x3fed4169L; l++)
103 {
104     usqrt(l, &q);
105     //printf("\nsqrt(%lx) = %X, remainder = %X\n", l, q.sqrt, q.frac);
106     printf("sqrt(%lx) = %X\n", l, q.sqrt);
107 }
108
109
110 printf("***** ANGLE CONVERSION *****\n");
111 /* convert some rads to degrees */
112 /* for (X = 0.0; X <= 360.0; X += 1.0) */
113 for (X = 0.0; X <= 360.0; X += .01) //EDITED
114     printf("%.3f degrees = %.12f radians\n", X, deg2rad(X));
115 puts("");
116 /* for (X = 0.0; X <= (2 * PI + 1e-6); X += (PI / 180)) */
117 for (X = 0.0; X <= (2 * PI + 1e-6); X += (PI / 5760))
118     printf("%.12f radians = %3.0f degrees\n", X, rad2deg(X));
119
120
121 return 0;
122 }
123 }
```

- c) Simulate the resulting program using the gem5 different CPU models and collect the following information:
- Number of instructions simulated
 - Number of CPU Clock Cycles
 - Clock Cycles per Instruction (CPI)
 - Number of instructions committed
 - Host time in seconds
 - Prediction ratio for Conditional Branches (Number of Incorrect Predicted Conditional Branches / Number of Predicted Conditional Branches)
 - BTB hits
 - Number of instructions Fetch Unit has encountered.
- Parameters f , g and h should be gathered exclusively for the out-of-order processor.

TABLE2: basicmath large program behavior on different CPU models

Parameters	AtomicSimpleCPU	TimingSimpleCPU	MinorCPU	DerivO3CPU
